You can rerun filtering (very quick), using this command with changed parameters:

```
python boltzgen_run input_spec.yaml --steps filtering --config filtering budget=60 alpha=0.05
```

You can also rerun filtering in a jupyter notebook if you want using `filter.ipynb``

What was run to produce this in the Filter task:

1. Filtering: each design is evaluated against mandatory thresholds.
2. Ranking: for every metric we compute its rank, then scale it by the metric's inverse-importance weight.

Designs with fewer passed filters are automatically penalised because the ranking key is the pair (num_filters_passed, metric). The overall quality score is the worst (maximum) of these scaled ranks.

The 10 best designs form the Top set.

3. Diversity: a lazy-greedy algorithm selects 30 designs that jointly maximise quality and minimise sequence similarity (sequence-identity distance). The trade-off is controlled by $\alpha = 0.001$:

- $\alpha = 0$ → 100 % quality focus (same as Top set)
- $\alpha = 1$ → 100 % diversity focus (ignores quality)
- Quality – composite of metrics such as iPTM, salt-bridges, Δ SASA, etc. Each metric has an "inverse importance" weight (see "Sorting Criteria" table). A larger weight divides the rank by a bigger number and therefore down-weights that metric.
- Diversity – 1 – sequence identity between designs.

We use $\alpha = 0.001$, meaning 100 % emphasis on quality, 0 % on diversity.

CSV Column Reference

designed_chain_sequence	full sequence of the chain containing designed residues (recommended for synthesis)
num_design	number of designed residues
secondary_rank	intermediate rank from the sorting procedure
design_ptm	predicted TM score for intra-design contacts (higher = better)
design_ip tm	predicted TM score for design-target contacts (higher = better)
design_to_target_ip tm	same as design_ip tm but for multi-chain designs
min_design_to_target_pae	minimum PAE between design & target (lower = better)
plip_saltbridge	number of salt-bridge interactions
plip_hbonds	number of hydrogen-bond interactions
plip_hydrophobic	number of hydrophobic interactions
delta_sasa_original	Δ SASA when binder present vs absent
delta_sasa_refolded	same as above but on the refolded structure

Filtering & Sorting Criteria

This section first lists threshold filters that every design must pass (Filtering Criteria table) then explains how designs are ranked (Sorting Criteria table) weighted by their inverse importance.
